

Angry Birds Game - MyAngryBirds

Samayra Meena (2023476), Tarandeep Singh(2023553)

Overview:

This Angry Birds-like game was developed using libGDX, a Java game development framework. The game features multiple levels, intuitive user controls, and various gameplay mechanics inspired by the classic Angry Birds game.

Classes Included:

- MyAngryBirds
- Bird
- Pig
- MediumPig
- LargePig
- RedBird
- yellowBird
- BlackBird
- Block
- CollisionHandler
- GameScreen
- GameScreen2
- GameScreen3
- PauseScreen
- PauseScreen2
- PauseScreen2
- LoseScreen
- WinScreen
- LevelsScreen
- LevelManager
- Material
- Wood
- Steel
- Glass
- Settings

Features Of The Game:

- Multiple Levels: The game includes three levels, each with different challenges.
- Physics Applied: The game uses realistic physics to launch birds and destroy structures.
- Level Selection Screen: Players can choose from various levels, with levels progressively unlocking as the game progresses.

- Responsive UI: The UI is fun to interact with. We've also added background music to HomeScreen, WinScreen, and LoseScreen.

How To Play?

- Launch the Game.
- Click on the Play Now button, and it will navigate to the **current level** you are on.
- Using the slingshot, drag the birds with the mouse pointer to hit the pigs.
- Unless you eliminate the pigs, you won't get to the **WinScreen**; all you'll get is the **LoseScreen**.
- Use the pause button to pause the game.
- You can quit the game using the Quit button.

Extra Features:

- The **yellowbird's speed** increased 1.5 times that of the usual birds.
- **Serialization** is used to navigate to the level where you left the game directly.
- Unless you quit the game, your progress will not go anywhere.
- Pig, Bird, and Material head classes encapsulate the entity's behaviors and physics interactions.

Contributions:

- **Tarandeep Singh**: The main functionalities of the game include physics and logic building.
- **Samayra Meena**: UI Design, debugging the code, and integrating the functionalities implemented.
